

## For Some, Luck Matters More

The impact of the Great Recession on Early Careers of Graduates from Different Socio-Economic Backgrounds

Emilia Del Bono and Greta Morando  
(University of Essex)

*SOLE/EALE IV Word Conference*  
Montreal, 28 June 2015

# Motivation

- *SES & Education*

- Education is one of the channels through which parental background affects the life chances of their offspring → inter-generational transmission of (dis-)advantages.
- Higher and better education leads to acquiring relatively better jobs.

- *Importance of early career and macroeconomic conditions at entry*

- First steps in one's career are particularly important in determining one's long-term labour market outcomes (wages and occupation).
- Young people are the most affected by downturns in the business cycle.

# Motivation

- *SES & Education*
  - Education is one of the channels through which parental background affects the life chances of their offspring → inter-generational transmission of (dis-)advantages.
  - Higher and better education leads to acquiring relatively better jobs.
- *Importance of early career and macroeconomic conditions at entry*
  - First steps in one's career are particularly important in determining one's long-term labour market outcomes (wages and occupation).
  - Young people are the most affected by downturns in the business cycle.

## Research questions

We want to understand whether the business cycle has a different effect on individuals from different socio-economic backgrounds (SES).

- If there is a gap in the labour market outcomes of graduates from different SES, does this worsen in periods of shrinking labour demand?
- Did the Great Recession have significant effects on social inequalities even within the population of most educated individuals?

## Why graduates?

- We can observe them at the time of entry into the labour market.
- Nowadays important part of the population.
- Large amount of information on their education features (observed individual and observed and unobserved institutional characteristics).
- Graduates = high skilled “future” workers → Is higher education enough to guarantee that people of different SES will have the same opportunities?

## Literature review I

Several papers on the effect of graduating in “bad times” on graduate careers:

- ▶ Altonji et al. (2014) USA: effects differ by field of study, but not for the latest recession.
- ▶ Oreopoulos et al. (2012) Canada: earnings for 10 years.
- ▶ Liu et al. (2012) Norway: job mismatch for 8 years or forever.
- ▶ Kahn (2010) USA: occupational attainment (measured with a prestige scale) and wages up to 15 years.
- ▶ Oyer (2006) USA: graduates in MBA less likely to work in Wall Street.
- ▶ Oyer (2008) USA: less productive PhD economists.

## Literature review II

UK evidence is usually focused on the effect of leaving school in “bad times” or the effect of “bad times” on the probability of leaving school:

- ▷ Taylor (2013): higher unemployment on leaving school (age 16) permanently & negatively influences individual labour market outcomes.
- ▷ Meschi et al. (2013): mainly no effect of unemployment on decision to stay on (age 16), although some heterogeneity by gender.
- ▷ Tumino and Taylor (2014): unemployment on leaving school (age 16) on decision to stay on, for individuals from different SES (credit constrained or not).

## Literature review III

Some papers look at SES-differences in graduate outcomes using a single cohort:

- ▶ Machin et al. (2009): 2002/03 cohort of graduates, some differences in outcomes when SES-marker is state vs. private school.
- ▶ Macmillan et al. (2014): 2006/07 cohort of graduates, linked to NPD (previous attainment), private school graduates are still 2.5 percentage points more likely to access top NS-SEC group.

Our contribution: graduates in the UK, various cohorts over time, Great Recession, SES & subject differences, several LM outcomes.

## Literature review III

Some papers look at SES-differences in graduate outcomes using a single cohort:

- ▶ Machin et al. (2009): 2002/03 cohort of graduates, some differences in outcomes when SES-marker is state vs. private school.
- ▶ Macmillan et al. (2014): 2006/07 cohort of graduates, linked to NPD (previous attainment), private school graduates are still 2.5 percentage points more likely to access top NS-SEC group.

Our contribution: graduates in the UK, various cohorts over time, Great Recession, SES & subject differences, several LM outcomes.

# DLHE

- Destination of Leavers from HE Survey
- Years of graduation: 2002/03 - 2011/12
- 6 months after graduation (questionnaire received in January)
- Demographic and socio-economic characteristics
- Measures of human capital (subject and degree class)
- Labour market outcomes

## Sample

- Full-time first degree graduates;
- 21-24 years old when surveyed (non-mature students);
- UK nationals with a valid UK domicile;
- Students who went to English universities.

## SES indicators I

- 1 **School**: state school/college vs. private school.
- 2 **Low Participation Neighborhood (LPN)**: whether the neighborhood where graduates come from has a high participation of its residents in HE.
- 3 **Parents' Socio-Economic Classification (PSEC)**: NS-SEC 8 but only from year of graduation 2005/06.
  1. Higher managerial, administrative and professional occupations;
  2. Lower managerial, administrative and professional occupations;
  3. Intermediate occupations;
  4. Small employers and own account workers;
  5. Lower supervisory and technical occupations;
  6. Semi-routine occupations;
  7. Routine occupations;
  8. Never worked and long-term unemployed.

PSEC=0 if  $SEC \geq 1$  and  $SEC \leq 2$ ; PSEC=1 otherwise.

These indicators do not approximate SES in the same way...

# SES indicators II

# Outcomes

## (a) *Labor market participation and activity status:*

- Post-graduate study vs. all other activity statuses;
- Paid work vs. all other activity statuses;
- Unemployed vs. all other activity statuses.

## (b) *Type of job:*

- PT work vs. FT work;
- Annual gross (ln)salary - only for FT work;
- Professional/managerial occupation (PT and FT);
- Qualification required for job (PT and FT);
- Permanent contract (PT and FT);
- Large firm >50 (PT and FT);

## (c) *Mechanisms*

- Social network
- Distance home/HEI-work

# Outcomes

## (a) *Labor market participation and activity status:*

- Post-graduate study vs. all other activity statuses;
- Paid work vs. all other activity statuses;
- Unemployed vs. all other activity statuses.

## (b) *Type of job:*

- PT work vs. FT work;
- Annual gross (ln)salary - only for FT work;
- Professional/managerial occupation (PT and FT);
- Qualification required for job (PT and FT);
- Permanent contract (PT and FT);
- Large firm >50 (PT and FT);

## (c) *Mechanisms*

- Social network
- Distance home/HEI-work

# Outcomes

## (a) *Labor market participation and activity status:*

- Post-graduate study vs. all other activity statuses;
- Paid work vs. all other activity statuses;
- Unemployed vs. all other activity statuses.

## (b) *Type of job:*

- PT work vs. FT work;
- Annual gross (ln)salary - only for FT work;
- Professional/managerial occupation (PT and FT);
- Qualification required for job (PT and FT);
- Permanent contract (PT and FT);
- Large firm >50 (PT and FT);

## (c) *Mechanisms*

- Social network
- Distance home/HEI-work

## Empirical model

$$Y_{iak,t+1} = \alpha + \beta UR_{at} * SES_i + \gamma SES_i + \delta UR_{at} + \chi UR_{at-3} + \\ + \kappa UR_{at-3} * SES_i + \rho X_i + \nu fees_{t>2009} + \phi_k + \theta_a + \delta_t + \rho(\theta_a * t) + \epsilon_{iak,t}$$

- Socio-demographic characteristics: gender, ethnicity, disability
- Academic and institutional characteristics: first degree classification, subject studied
- Changes in composition: UR at time of enrollment and its interaction with SES (LADs)
- Propensity to move: Distance from domicile and HE institution (Km)
- FE: area/major, time, area/major specific trends, HE institution

Wild cluster bootstrap → regions/major

Note: most results in this presentation are preliminary - wild bootstrap used only where specified in note.

## Empirical model

$$Y_{iak,t+1} = \alpha + \beta UR_{at} * SES_i + \gamma SES_i + \delta UR_{at} + \chi UR_{at-3} + \\ + \kappa UR_{at-3} * SES_i + \rho X_i + \nu fees_{t>2009} + \phi_k + \theta_a + \delta_t + \rho(\theta_a * t) + \epsilon_{iak,t}$$

- Socio-demographic characteristics: gender, ethnicity, disability

- FE: area/major, time, area/major specific trends, HE institution

Wild cluster bootstrap → regions/major

Note: most results in this presentation are preliminary - wild bootstrap used only where specified in note.

## Which UR?

Our identification strategy requires variation in UR across time, but it is useful to exploit other dimensions:

- *across regions:*

- ▷ England (N-E, N-W, Yorkshire and The Humber, E Midlands, W Midlands, E, London, S-E, S-W), Wales, Scotland, and Northern Ireland.

- Region of family of residence = **Home**

- Region of HE institution = **HEI** (England only) Region of job

Jobs' characteristics

- Claimant-count definition

- Labour Force Survey definition UR regions

- *across subjects:*

- ▷ Medicine, Medical related subjects, Biological Science, Physical Science, Maths & Computing, Engineering & Technology, Architecture and related subjects, Social Studies, Business and Financial studies, Communication, Languages, Arts, Humanities, Education.

- Labour Force Survey → graduates > 25 y.o. UR subjects

## Which UR?

Our identification strategy requires variation in UR across time, but it is useful to exploit other dimensions:

- **across regions:**

- ▷ England (N-E, N-W, Yorkshire and The Humber, E Midlands, W Midlands, E, London, S-E, S-W), Wales, Scotland, and Northern Ireland.

- Region of family of residence = **Home**

- Region of HE institution = **HEI** (England only) Region of job

Jobs' characteristics

- Claimant-count definition

- Labour Force Survey definition UR regions

- Labour Force Survey → graduates > 25 y.o. UR subjects

# Unemployed and PT job at 6 months after graduation

## How do graduates from different SESs differ?

Possible reasons explaining differences in LM outcomes between low/high SES graduates (all confirmed with Chi-squared test):

- 1 *Different academic ability/quality of education*: high SES better academic preparation at school and better performances in HE; differences in major chosen and in kind of HEI attended.  
**Academic differences**
- 2 *Different quality of social networks*: higher proportion of high SES found job through family/friends. **Social network**
- 3 *Different geographical mobility ( $\simeq$  financial constraints, aspirations, motivation)*: among those graduates who are employed, high SES moved farther away from home/HEI than low SES. **Geographical mobility**

We will see that even after controlling for individual academic characteristics and observed and unobserved institutional characteristics, the increase in the gap between high and low SES persists during the recession. Hence, we will investigate the last two points as possible mechanisms through which students adjust their entry in the labor market to the current macroeconomic condition at graduation.

## How do graduates from different SESs differ?

Possible reasons explaining differences in LM outcomes between low/high SES graduates (all confirmed with Chi-squared test):

- 1 *Different academic ability/quality of education*: high SES better academic preparation at school and better performances in HE; differences in major chosen and in kind of HEI attended.

<i>N</i>	593,201	112,844
Low PSEC * UR home	-0.011+ (0.006)	-0.006 (0.004)
<i>N</i>	349,211	73,136

Note: \*\* p-value<0.001; \* p-value<0.05; + p-value<0.10. S.e. corrected with wild bootstrap (100 reps).

## Heterogeneity

We then run the regressions for several subgroups based on gender, ethnicity, university “quality”, STEM/non-STEM subjects, lowest/highest net financial rates of return subjects (Walker & Zhu 2010). Some interesting findings (v. preliminary results):

- outcomes on activity status: SES gap found in males, non-white, lowest and highest return subjects.
- outcomes on quality of job: SES gap found especially among men, white, non-STEM subjects and humanities and arts subjects.
- in the Golden Triangle group we don't find any increase in the SES gap during the Recession except for PT employment.
- use of network: significant in the groups of white, males, and law and business subjects but not in the counterpart groups (~ quality of job)
- distance HEI-work: SES gap not found only in the ex-polytechnics group.

Table groups

⇒ need to investigate this better with fully interacted

# Robustness checks

- Including distance home-HEI \* SES

Distance\*SES

- Including tariff score (from year of graduation 2005/06)

Tariff score

- Restricting to 3-year courses

3-year courses only

## Summary

- Higher unemployment at the time of graduation pushes young people to stay in education
- Less so for low-SES students, who end up being in unemployment
- Among those who find a job, low-SES students are more likely to get a PT job
- Evidence that there might also be SES-differences in the quality of the job found
- Evidence that social network and geographical mobility might explain why the gap between high and low SES graduates increases during downturns
- The Great Recession has significantly increased the SES-gap in graduate outcomes!

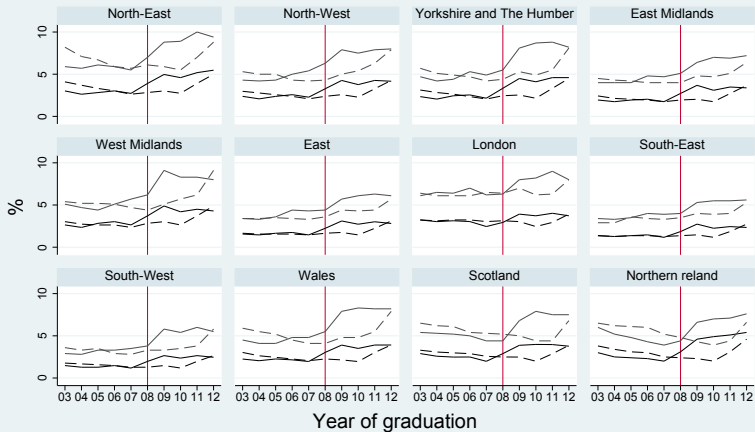

## Summary

- Higher unemployment at the time of graduation pushes young people to stay in education
- Less so for low-SES students, who end up being in unemployment
- Among those who find a job, low-SES students are more likely to get a PT job
- Evidence that there might also be SES-differences in the quality of the job found
- Evidence that social network and geographical mobility might explain why the gap between high and low SES graduates increases during downturns
- The Great Recession has significantly increased the SES-gap in graduate outcomes!

## Directions for future research

- Different measure of SES (Index of Multiple Deprivation)
- Check possible changes in “academic” behavior of cohorts studying/enrolling during recession
- Use LFS-imputed wages
- Consider what happens 3 and 1/2 years after graduation
